

The background is a light blue gradient with several realistic water droplets of various sizes scattered across it. A faint, large circular pattern, resembling a ripple or a lens flare, is centered in the upper half of the image.

OBSERVABLES

JOHAN KUSTERMANS

PLANNING

- Context
- Introduction of Observables
- Components & Observables
- Operators
- Examples

The background is a light blue gradient. In the top-left and bottom-right corners, there are several realistic water droplets of various sizes, some overlapping. In the top-center, there is a faint, circular, embossed-like pattern that resembles a stylized flower or a complex geometric design.

Reactive Extensions

ReactiveX - RX

<http://reactivex.io>

“An API for asynchronous programming based on Observable streams”

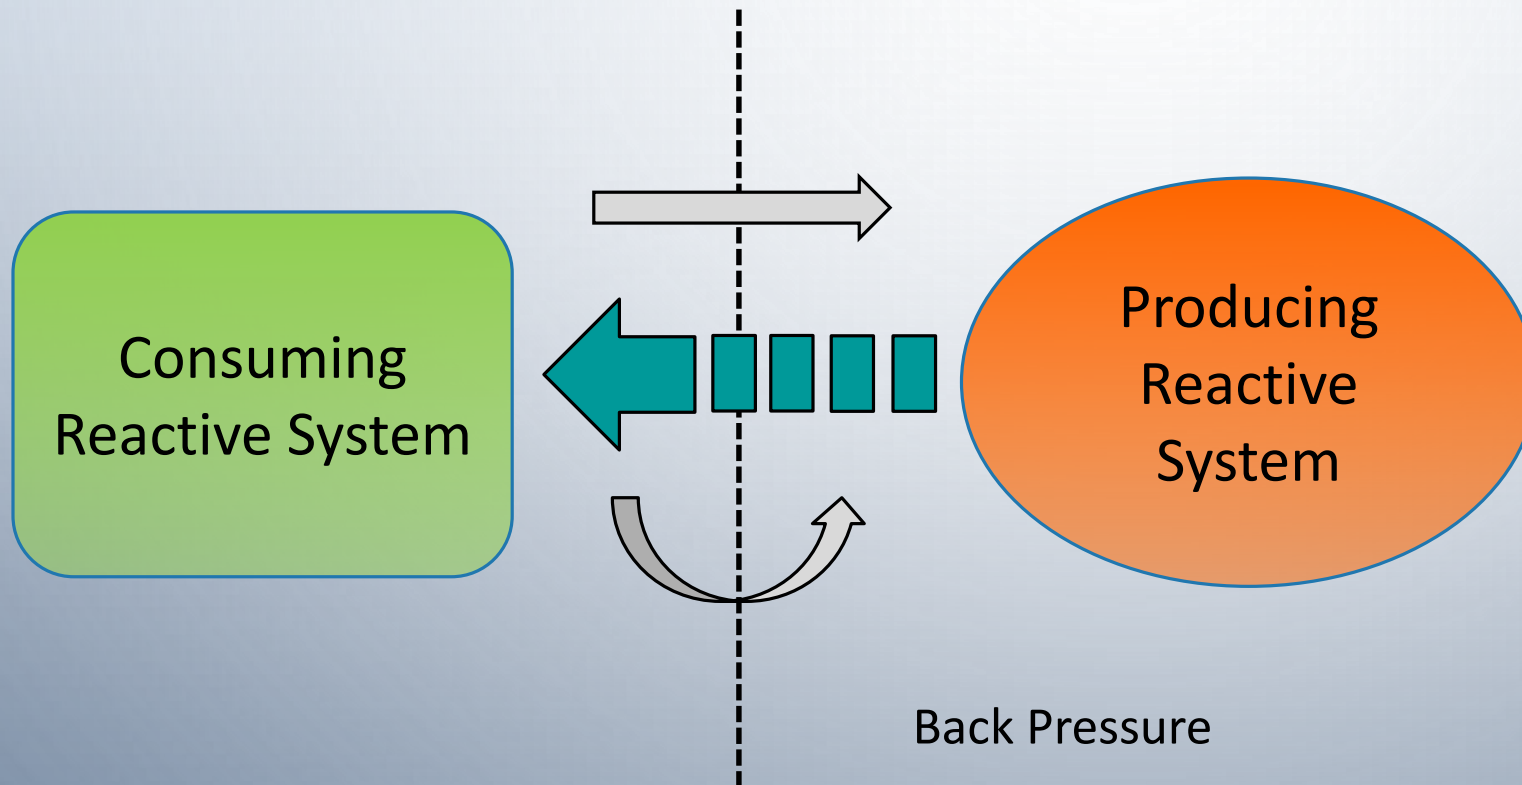

Functional Reactive Programming

Multiple Implementations:

- C# (origins, Erik Meijer)
- Javascript : [RxJS 5](#)
- Java : [RxJava](#) (1 & 2)

Reactive Streams

“Govern the exchange of stream data accross an aynchronous border”

Implementations

- RxJava
- Spring Reactor -> Spring 5
- Play & Akka Streams

The background is a light blue gradient. In the top-left and bottom-right corners, there are several realistic water droplets of various sizes, some overlapping. A faint, circular, textured pattern is visible in the upper center of the image.

Observables

Observables (RXJS)

- Angular 2 heavily relies on observables: event system, routing, http, forms, QueryList.
- An Observable<T> is a stream of data items (of type T) over time that
 - Can be observed in an asynchronous way
 - Can be transformed into another stream.
e.g. transform each element in the stream to another type.
 - Can be composed with other streams.

Observables

- Examples
 - Stream of click events from a button.
 - Result of a HTTP call.
 - Stream of data over a web socket.
 - Stream of messages from a queue.
- Typical example
 - Autocomplete in angular 2 (see later)

As a result of a method call

M
a
n
y

$T[]$

Observable<T>

O
n
e

T

Promise<T>

Pull

Synchronous:
Values are immediately
available.

Asynchronous:
Values are available
in the futurer.

Push

Observable Subscription

Most basic way to consume an observable: via a subscription.

```
Let obs : Observable <T> = ... retrieved e.g. from http call

subscription = obs.subscribe(
    item => ... handle item ... ,
    error => ... handle error ...,
    ()      => ... handle completion ...
)
```

A subscription can be canceled! (e.g. the underlying http request will be canceled)

```
subscription.unsubscribe()
```

Observable Creation

- Factory methods:
 - `Observable.of`
 - `Observable.fromPromise`
 - `Observable.throw`
 - `Observable.interval`
- `Observable.create((subscriber:Subscriber) => TeardownLogic)`
Example: source code of `xhr_backend`

Components

Component Tree

Component

Component : self descriptive unit

- State and behaviour defined in class
- View via HTML Template
- Defines Input & Output API
- Wiring via dependency injection
- Well defined Lifecycle & callbacks: onInit, onDestroy, ...

Anatomy of a Component

application-header.ts

```
@Component({  
  selector: "application-header"  
  templateUrl: "application-header.html"  
})  
class ApplicationHeaderComponent {  
  
  applicationName : string;  
  
  search() : void {  
    ... perform search ...  
  }  
}
```

application-header.html

```
<span>{{applicationName}}</span>  
  
<button (click)="search()">Search</button>
```

application.html

```
<application-header></application-header>  
<div>  
  ... application content ...  
</div>
```

Components

application-header.ts

```
@Component({
  selector: "application-header"
  templateUrl: "application-header.html"
})
class ApplicationHeaderComponent {

  @Input()
  applicationName : string;

}
```

application.ts

```
@Component({
  selector: "application"
  templateUrl: "application.html"
})
class ApplicationComponent {

  name : string = "Angular 2 Workshop";

}
```

application.html

```
<application-header [applicationName]="name" />
<div>
    ... application content ...
</div>
```

The background is a light blue gradient. In the top-left and bottom-right corners, there are several realistic water droplets of various sizes, some overlapping. A faint, circular, textured pattern is visible in the upper center of the image.

Components & Observables

Outputs

application-header.ts

```
@Component({})  
class ApplicationHeaderComponent {  
  
    search(value:string) : void {  
        this.onSearch.next(value);  
    }  
  
    @Output()  
    onSearch : EventEmitter<string>;  
}
```

application-header.html

```
<input type="text" #searchInput>  
  
<i (click)="search(searchInput.value)" />
```

application.html

```
<application-header (onSearch)="performSearch($event)" />  
<div>  
    ... application content ...  
</div>
```

The background is a light blue gradient. In the top-left and bottom-right corners, there are several realistic water droplets of various sizes, some overlapping. A faint, large, light-blue watermark is centered in the upper half of the image. It consists of a circle containing a stylized 'E' and a square containing a stylized 'S', with the text 'ESSENTIALS' written in a circular path around the 'E'.

Operators

Operator API : Composable & Rich

- Most operators on an observable return a new observable that can be further operated on
 - => This allows for operator chaining!

- API: <http://reactivex.io/rxjs/>

Manual: <http://reactivex.io/rxjs/manual>

In Depth: <http://reactivex.io/documentation/operators>

Transform: map, reduce, ...

Filter: filter, debounce, take, takeWhile, skip, sample, ...

Combine: merge, concat, combineLatest,
mergeAll, mergeMap, concatMap, groupBy, switchMap, ...

Error Handling: catch, retry, onErrorResumeNext

- Cold / hot observables

Map

Merge

MergeAll

MergeMap (FlatMap)

SwitchMap

The background is a light blue gradient. In the top-left and bottom-right corners, there are several realistic water droplets of various sizes, some overlapping. A faint, circular, textured pattern is visible in the upper center of the image.

Releasing Observable Resources

Disposing Observable Execution

- Some observable executions are disposed of because they are finished.
- Other observable executions are only disposed if all subscriptions have unsubscribed.

In Angular 2 components you can do this in the `ngOnDestroy` lifecycle callback.

```
@Component({})  
class MyComponent implements OnDestroy {  
  
    ngOnDestroy() : void {  
        this.mySubscription.unsubscribe();  
    }  
}
```

Some Use Cases

Some use cases

- Http
- Routing (see next timing)
- Forms: observe changes
- Cache: inform components of data updates
- Listen to server updates (Websocket, Stomp)
